Patent No. 6391610
GENERAL INFORMATION:
APPLICANT: Apte, Suneel
APPLICANT: Hurskainen, Tiina L.
APPLICANT: Hirohata, Satoshi
TITLE OF INVENTION: Nucleic Acids Encoding Zinc Metalloproteases
FILE REFERENCE: 264374007/10-30-00
CURRENT APPLICATION NUMBER: US/09/369, 364A
NUMBER OF SOD DATE: 1999-08-06
NUMBER OF SOD DOS: 31
SOFTWARE: Patentin Ver. 2.1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       83;

                                         This invention relates to a metalloprotease with aggrecanase activity. The invention includes protein and DNA sequences of the metalloprotease, vectors containing the DNA, host cells transformed by the vectors, and antibodies directed against the metalloprotease. The antibodies, protein and DNA sequences can be used in the treatment and prevention of joint diseases, particularly osteoarthritis. The treatment may result in osteopathic and antiarthritis cativity. The present sequence represents the metalloprotease of the invention termed MDTS6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                840

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                NHPS share structural similarity with animal processes particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         PNASAPAAQRNSQGAHLLQRRGVPGGPSGDPTSRCGVASGWNPAILRALDPYKPRRAGFG 199

                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polymuclectides and polypeptides of the invention are useful in the diagnosis, treatment and prevention of gastrointestinal e.g. gastritis, esophageal cartinoma and Crohn's disease, cardiovascular e.g. atherosalcerosis, hypertension and myocardial infarction, autolimune/filammatory e.g. acquired immunodeficiency syndrome (AIDS), allergies and osteoarthritis, cell proliferative e.g. cancer, developmental e.g. Duchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infertility and endometriosis disorders. Numerous other examples, of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-11 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ESRSRRRSGRAKRFVSIPRYVETLVVADESMVKFHGADLEHYLLTLLATAARLYRHPSIL 259

The invention relates to an isolated, enriched, or purified protease polypeptide (1) and polynucleotide (11) encoding (1). (1) may be used to screen for substances (5) that may modulate its activity. Administering S which modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or hammarchopleitic origin, of the breast, colon, lung, prostrate, cervical, hearin, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, sexual dysfunction, mood disorders, attention disorders, naurological disorders, hypotension, hypetrension, psychotic disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders uch as those above. Ad172876-AA0172910 represent human clissorders amino acid sequences of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly ain entalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel nucleic acid encoding a human protease, useful as a hybridization probe for screening libraries and assessing gene expression patterns -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.

The present sequence is human metalloproteinase ADAMTS-5. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell

Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis
migration, inflammation and/or angiogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases

The present sequence is mouse metalloproteinase ADAMTS-1. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases -

                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a novel human metalloproteinase-disintegrin protein with a thrombospondin domain (ADAMTS-1). The protein may be used in drug compositions and foodstuffs, as an agent for decreasing the leukocyte and thrombocyte blood count and increasing the erythrocyte blood count, e.g. for treatment of inflammatory diseases such as rheumatoid arthritis, hepatitis, nephritis, Crohn's disease, asthma
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Metalloproteinase-disintegrin protein with a thrombospondin domain; ARDS; ADAMYS-1; drug composition; foodstuff; leukocyte; thrombocyte; hepatitis; blood; erythrocyte; inflammatory disease; rheumatoid arthritis; asthma; nephritis; crohn's disease; acute respiratory disease syndrome.
                                                                                                                                                                                                                                                                                                    262 MCDPKRSCSVIEDDGLPSAFTTAHELGHVFNMPHDNVKVCEEVFGKLRANHMMSPTLIQ1 321
and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.

The present sequence represents a murine ADAWTS-1 protein. ADAWTS-1 is a metalloproteinase. The specification describes another related metalloprotease, a C. elegans GON-1 protein, that lacks a transmembrane domain and possesses a predicted metalloprotease domain between residues 569-456. In C. elegans hermaphrodites, GON-1 is required for migration of two distal tip cells to produce elongated tubes, whereas in males, GON-1 is required the The protein is used in the method of the invention. The specification describes a metalloproteinse domain and a thrombospondin protein that contains a metalloproteinse domain and a thrombospondin
                                                                                                                                                           GON-1; metalloproteinase; cell migration; modulator; ADAMTS-1; metalloproteinase domain; thrombospondin domain; abnormal cell migration; organ shaping; sterility; cancer metastasis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  domain. The method comprises treating a target organism, having a developing gonadal cell that is responsive to the protein, with a test attributeable to the test compound. The compounds identified are potential therapeutic modulators of abnormal cell migration and organ shaping, e.g. for rendering animals (specifically nematodes) sterile and for inhibiting cancer metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying modulators of proteins containing metalloprotease and thrombospondin domains, potentially useful for controlling cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human ADAM-type metalloprotease MDTS4, SEQ ID NO:4.
                                                                                                                Amino acid sequence of a murine ADAMTS-1 protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                XEXEX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              metalloprotease thrombospondin (METH) proteins METH1 and METH2
respectively. METH1 and METH2 have been found to be potent inhibitors of
anglogenesis both in vitro and in vivo. They can be used for treating
cancer and other disorders related to anglogenesis including abnormal.
wound healing, inflammation, rheumatoid arthritis, psoriasis,
candometrial bleeding disorders, diabetic rethinopathy, some forms of
macula degeneration, haemangiomas, and arterial-venous malformations.
They may be useful in treating deficiencies or disorders of the immune
system, by activating or inhibiting the proliferation, differentiation,
complisation (chemotaxis) of immune cells. The etiology of these
immune deficiencies or disorders may be genetic, sometic, such as
cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or
toxins), or infectious. They can also be used to treat inflammatory
conditions, both chronic and acute conditions. The products can also be
used for detection and diagnosis. AA323002 to AA323080, and AA449503 to
AA449511 represent sequences given in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ő
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated metalloprotease thrombospondin polypeptides, useful for treating hyperproliferative disorders, cancers or autoimmune disorders

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                       The invention relates to the novel human ADAM (A Disintegrin And Metalloprocease)-type metalloproteases MDTS4 (AAB73549) and MDTS5 (AAB73550). The metalloproteases can be used for the treatment of cancers and arthritis. The invention also relates to the genes encoding MDTS4 and MDTS5, vectors and host cells containing the MDTS6 or MDTS5 genes, the recombinant production of MDTS4 and MDTS5, and antibody specific for MDTS4 or MDTS5, and methods of screening for compounds which modulate the activity of MDTS4 and/or MDTS5. The present

The present sequence is human METH1 (ME for metalloprotease and TH for thrombospondin). METH1 can be used for inhibiting angiogenesis in an individual, and for treating cancer, benjagn tumours, an ocular angiogenic disease, rheumatoid arthritis, psoriasis, delayed wound healing, endometriosis, vasculogenesis, granulations, hypertrophic scars, nonunion fractures, scleroderma, trachoma, vascular adhesions, myocardial angiogenesis, coronary collaterals, cerebral collaterals, arteriovenous malformations, ischaemic limb angiogenesis, Osler-Webber syndrome, plaque necvascularisation, telangiectasis, haemophiliac joints, angiofibroma, fibromuscular dysplasia, wound granulation, Crohn's disease or atherosclerosis. METH1 can also be used in birth control. METH1 can also be used in diagnostic methods for the prognosis of cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ITGL-TSP; integrin ligand; angiogenic disease; cancer; atherosclerosis; chronic inflammatory disorder; rheumatoid arthritis; tissue remodeling; macular degeneration; diabetic retinopathy; Alzheimer's disease; human;

ITGL-TSP polypeptides can be used in the treatment of angiogenic diseases such as cancer, cancer metastasis, chronic inflammatory disorders, rheumatoid attrititis, atheroscierosis, macular degeneration or diabetic retinopathy, restenosis, Alzheimer's disease and tissue remodeling. They can be used to treat a subject in need of enhanced activity or expression of the ITGL-TSP polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                        DNA encoding integrin ligand polypeptide ITGL-TSP - used to treat anglogenic diseases, restenosis, Alzheimer's disease and in tissue remodeling
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

Sequence 13, Application US/09130491

Sequence 13, Application US/09130491

Patent No. 6416974

GENERAL INFORMATION:

APPLICANT: HOLICAMEN DOUGLAS A.

APPLICANT: GOOGMAIL, ANDREW D.J.

TITLE OF INVENTION: TANGO-71, TANGO-73, TANGO-74, TANGO-76, AND TANGO-83

FILE REFERENCE: 09404/041001

CURRENT APPLICATION NUMBER: US/09/130,491

CURRENT FILING DATE: 1997-09-05

EARLIER APPLICATION NUMBER: US 60/058,108

EARLIER FILING DATE: 1997-09-05

EARLIER FILING DATE: 1997-09-06

NUMBER OF SEQ ID NOS: 16

NUMBER OF SEQ ID NOS: 16

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                    US-10-009-332-1

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 9, Application US/09369364A

Sequence 9, Application US/09369364A

Patent No. 6391610

GENERAL INFORMATION:

APPLICAWT: Abte, Sunce!

APPLICAWT: Hurskainen, Tiina L.

APPLICAWT: Hurskainen, Tiina L.

APPLICAMT: Hurskainen, Tiina L.

TITLE OF INVENTION: Nucleic Acids Encoding Zinc Metalloproteases;

FILE REFERENCE: 26473/4007/10-30-00

CURRENT APPLICATION NUMBER: US/09/369,364A

CURRENT FILING DATE: 1999-08-06

SOUTHWARE: PatentIn Ver. 2.1

SEQ ID NO 9

LENGHH: 905

                                     This invention relates to a metalloprotease with aggrecanase activity. The invention includes protein and DNA sequences of the metalloprotease, vectors containing the DNA, host cells transformed by the vectors, and antibodies directed against the metalloprotease. The antibodies, protein and DNA sequences can be used in the treatment and prevention of joint diseases, particularly osteoarthritis. The treatment may result in osteopathic and antiarthritic activity. The present sequence represents the metalloprotease of the invention termed MDTS6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           692

Human; novel human protein; NHP; protease; biological disorder; obesity; high blood pressure; arthritis; connective tissue disorder; infertility; gene therapy; enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid encoding a human protease, useful as a hybridization probe for screening libraries and assessing gene expression patterns -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     452
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        HRVDGSWAKWDPYGPCSRTCGGGVQLARRQCTNPTPANGGKYCEGVRVKYRSCNLEPCPS 360

```
The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polynucleotides and polypeptides of the invention are useful in the diagnosis, treatment and prevention of gastrointestinal e.g. gastritis, esophageal carcinoma and Crohn's disease, cardiovascular e.g. atherosclerosis, hypertension and myocardial infarction, autoimmune/inflammatory e.g. acquired immunodeficiency syndrome (AIDS), allergies and osteoarthritis, cell proliferative e.g. cancer, developmental e.g. Duchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infertility and endometriosis disorders. Numerous other examples of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-11 protein of the invention.

                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to an isolated, enriched, or purified protease polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to screen for substances (S) that may modulate its activity. Administering S (which modulates protease activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or heading to dispin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migraine, pain, exual dysfunction, mood disorders, attention disorders, neurological disorders, hypotension, hypertension, psychotic disorders, neurological disorders and dystinesias), metabolic disorders and inflammatory disorders uch as those above. AA072876-AA072910 represent human cid sequences of the invention.

metalloprotease thrombospondin (METH) proteins METH1 and METH2
metalloprotease thrombospondin (METH) proteins METH1 and METH2
respectively. METH1 and METH2 have been found to be potent inhibitors of
angiogenesis both in vitro and in vivo. They can be used for treating
cancer and other disorders related to angiogenesis including abnormal
wound healing, inflammation, rheumatoid arthritis, psoriasis,
endometrial bleeding disorders, diabetic retinopathy, some forms of
macula degeneration, haemangiomas, and arterial venous malformations.
They may be useful in treating deficiencies or disorders of the immune
system, by activating or inhibiting the proliferation, differentiation,
or mobilisation (chemotaxis) of immune cells. The etiology of these
immune deficiencies or disorders may be genetic, somatic, such as
cancer or some autoimmune disorders, acquired (e.g. by chemotherapy or
toxins), or infectious. They can also be used to treat inflammatory
conditions, both chronic and acute conditions. The products can also be
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated metalloprotease thrombospondin polypeptides, useful for treating hyperproliferative disorders, cancers or autoimmune disorders

The invention relates to the novel human ADAM (A Disintegrin And Metalloprotease)-type metalloproteases MDTS4 (AAB73549) and MDTS5 (AAB73550). The metalloproteases can be used for the treatment of cancers and archritis. The invention also relates to the genes encoding MDTS4 and MDTS5, vectors and host cells containing the MDTS4 or MDTS5 specific for MDTS4, and methods of screening for compounds which modulate the activity of MDTS4 and/or MDTS5. The present

ITGL-TSP polypeptides can be used in the treatment of anglogenic diseases such as cancer, cancer metastasis, chronic inflammatory disorders, rheumatoid arthritis, atherosclerosis, macular degeneration or diabetic retinopathy, restenosis, Alzheimer's disease and tissue remodeling. They can be used to treat a subject in need of enhanced activity or expression of the ITGL-TSP polypeptide.

                                      The present sequence represents human Tango-71. Tango polypeptides are useful for identifying compounds which bind the polypeptide via direct binding, competition binding assays or Tango-71, -73, -74, 76 or -83-mediated signal transduction. Tango polypeptides are also useful for identifying modulating compounds by determining effect on Tango activity. Tango polypeptides and nucleic acids are useful for diagnosing diseases related to aberrant expression of Tango, and Tango polypeptides are useful for asising antibodies which can be used in diagnostic assays for detection of Tango, and also for generating anti-idiotype antibodies for

The present invention relates to human METH1 and METH2 (ME for metalloprotease and TH for thrombospondin; see AAB50002 and AAB50003).

METH can be used for inhibiting angiogenesis in an individual, and for treating cancer, benign tumours, an ocular angiogenic disease, rheumatcoid arthritis, psoriasis, delayed wound healing, endometriosis, vasculogenesis, granulations, hypertrophic scars, nonunion fractures, scleroderma, trachoma, vascular adhesions, myocardial angiogenesis, coronary collaterals, cerebral collaterals, arteriovenous malformations, ischaemic limb angiogenesis, Osler Webber syndrome, plaque neovascularisation, telangiectasia, haemophiliac joints, angiofibroma, fibromuscular dysplasia, wound granulation, Crohn's disease or atherosclerosis. METH can also be used in birth control. METH can also be used in hirth control. METH can also be used in the present invention.
                                                                                                                            Human; METH1; metalloprotease; thrombospondin; angiogenesis inhibition;
                                                                                                                                        cancer therapy; benign tumour; ocular angiogenic disease; rheumatoid arthritis; psoriasis; wound healing; endometriosis; vasculogenesis; granulation; hypertrophic scar; nonunion fracture; scleroderma, trachoma; vascular adhesion; myocardial angiogenesis; coronary collateral; cerebral collateral; arteriovenous malformation; ischemic limb angiogenesis; Osler Webber syndrome; plaque neovascularisation; telangiectasia; hemophiliac joint; angiofibroma; fibromuscular dysplasia; wound granulation; crohn's disease; atherosclerosis; birth control.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        METH1 and METH2 polynucleotides and encoded polypeptides, used to inhibit angiogensis in the treatment of disorders such as cancer, rheumatoid arthritis and psoriasis -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 SH;

fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAX04302) for increasing the stability of the fused protein as compared to the human protein only.

The invention relates to 86 novel genes and their fragments (nucleic acid sequences: AAX04311-X04410; amino acid sequences AAW78126-W78225) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 86 polynucleotides, based on which tissues they are most highly expressed in
                                                                                                                                                                                                                                                                          11;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           476

The present sequence represents a murine ADAWTS-1 protein. ADAWTS-1 is a metalloproteinase. The specification describes another related a metalloprotease, a C. elegans GON-1 protein, that lacks a transmembrane domain and possesses a predicted metalloprotease domain between residues CS 69-456. In C. elegans hermaphrodites, GON-1 is required for migration of a single linker cell to produce a single is required for migration of a single linker cell to produce a single clongated tube. The protein is used in the method of the invention. The specification describes a method for identifying a modulator of a protein that contains a method for identifying a modulator of a protein that contains a method for identifying a modulator of a protein that contains a methologonia compound, and determining a target organism, having a developing gonadal cell that is responsive to the protein, with a test compound, and determining any change in migration or shape of the cell attributable to the test compound. The compounds identified are attributed to the rest compound. The compounds identified are structubuted and later adulators of abnormal cell migration and organ shaping, e.g. for rendering animals (specifically nematodes) sterile and for inhibiting cancer metastases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            12;

The present sequence is mouse metalloproteinase ADAMTS-1. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell magration, inflammation and/or anglogenessis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    536

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is human metalloproteinase ADAMTS-5. The ADAMTS family of proteins is closely related to the ADAM (A Disintegrin and Metalloproteinase Domain) family. Members of the ADAMTS family contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, useful for any associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Polynucleotide encoding novel members of a disintegrin, metalloproteinase and thrombospondin domain protein family used to prevent and treat Alzheimer's disease, cancer and autoimmune diseases

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | SIDS2/gcgdata/geneseq/geneseqp-emb1/AA1990.DAT:

                                                                                                                                                                            ö
                                                 The invention includes protein and bNA sequences of the metalloprotease, vectors containing the DNA, host cells transformed by the vectors, and antibodies directed against the metalloprotease. The antibodies, protein and DNA sequences can be used in the treatment and prevention of joint diseases, particularly osteoarthritis. The treatment may result in osteopathic and antiarthritic activity. The present sequence represents the metalloprotease of the invention termed MDTS6.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 780

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel nucleic acid encoding a human protease, useful as a hybridization probe for screening libraries and assessing gene expression patterns -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is novel human protein (NHP), human protease. NHPs share structural similarity with animal proteases particularly zinc metalloproteases. Sequences of the invention are useful in therapeutic, diagnostic and pharmacogenomic applications. NHP polynucleotides are used as hybridisation probes for screening libraries and assessing gene expression patterns. They can also be used for treating related biological disorders such as obesity, high blood pressure, arthritis, connective tissue disorders and infertility. They are also used in gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        GGLRGAFGYRGAEYVISPLPNASAPAAQRNSQGAHLLQRRGVPGGPSGDPTSRCGVASGW 180

The present invention relates to twenty one new human proteases, referred to as PRTS-1 to PRTS-21. The PRTS polynucleotides and polypeptides of the livrention are useful in the diagnosis, treatment and prevention of gastrointestinal e.g. gastritis, esophageal carcinoma and Crohn's disease, cardiovascular e.g. atherosclerosis, hypertension and immunodeficiency syndrome (AIDS), allergies and osteoarthritis, cell proliferative e.g. cancer, developmental e.g. Duchenne and Becker muscular dystrophy, epithelial e.g. dermatitis, neurological e.g. epilepsy and Alzheimer's disease and reproductive e.g. infertility and endometriosis disorders. Numerous other examples of each disorder are given in the specification. The present protein sequence represents the human protease PRTS-11 protein of the invention.

The invention relates to an isolated, enriched, or purified protease polypeptide (I) and polynucleotide (II) encoding (I). (I) may be used to screen for substances (S) that may modulate its activity. Administering screen for substances activity in vitro) may be used to treat a disease or disorder selected from cancers (e.g., of tissues, of blood or haematopoletic origin, of the breast, colon, lung, prostrate, cervical, brain, ovarian, bladder or kidney), immune-related diseases and disorders, cardiovascular disease, brain or neuronal-associated diseases (e.g., central or peripheral nervous system diseases, migralne, pain, sexual dysfunction, mood disorders, attention disorders, neurological disorders and dyskinesias), metabolic disorders and inflammatory disorders also has also be useful as a diagnostic tool for a disease or disorder such as those above. contain a thrombospondin domain in addition to the disintegrin and metalloproteinase domains found in the ADAMS. ADAMTS polypeptides are useful for the manufacture of medicaments for treating conditions associated with neuroinflammation and/or neurodegeneration, such as Alzheimer's disease, Parkinson's disease and stroke. They are also useful for treating conditions associated with cell proliferation, cell migration, inflammation and/or anglogenesis, such as cancer, arthritis and autoimmune diseases. They can be used to treat patients afflicted with an invasive tumour, a brain tumour or brain injury.
